

FytoClone Instructions

MICROGREEN PROPAGATION

BEFORE YOU BEGIN...

Pre-soak the Fytoclone for 24 hours in a container with 1 part water to 1 part Fytoclone

NB: The material is always easier to handle if it is moist.

YOU ARE NOW READY TO BEGIN...

1. Using a measuring container that will match the quantity required to fill the germination punnet to the required level.

NB: It is important to adjust the liquidity of the mix, so that there is enough water in the mix to enable the material to settle to the required level without running out the drainage holes. Too dry, and it will not settle evenly in the punnet. – lightly compress.

2. Sow the seeds and cover
3. Lightly water with a soft spray nozzle to settle the seeds.
4. Place in a germination chamber until emergence.
5. Unless conditions are very dry, it is unlikely that you will need to water again until after emergence and then only sparingly.
6. Please be conscious of **NOT OVERWATERING.** Uniformity of watering is important for uniform growth
